This SQL file completes the 15 tasks from Laboratory Work 3 using basic PostgreSQL commands.

- **INSERT** adds new records: 200 sample airports, KazAir, three other airlines, and a baggage inspection.
- **UPDATE** changes existing information, such as airline countries, ticket prices, airport states, and inspection results.
- **DELETE** removes records that match conditions, such as flights arriving in 2024 or tickets costing less than 10,000.
- **WHERE** specifies which records to change or delete.
- **NOW()** provides the current date and time.
- **UPPER()** converts text to uppercase.
- **RETURNING** displays the ID and creation time of the inserted baggage inspection.

The code uses the table structure from Lab 2. Before running it, the new IDs must be unused, and the baggage inspection must reference an existing booking and its passenger.
